VIBRATION ANALYSIS OF A MASS WITH AN ARBITRARY NUMBER OF ISOLATORS
Revision B

By Tom Irvine

December 19, 2011

Introduction

An avionics component may be mounted with isolator grommets, which act as soft springs. The goal of the isolator design is to provide attenuation of shock and vibration energy. This is achieved primarily by lowering the natural frequency of the component system. In addition, the isolators provide damping.

Consider a component with a complex geometry that is to be mounted via an arbitrary number of isolators, as shown in Figures 1 and 2. Assume that the component’s hardmounted natural frequency is at least one octave greater than any of its isolation frequencies.

The objective is to derive the equations of motion for this system, accounting for six degrees-of-freedom.
The mass and inertia are represented at a point with the circle symbol. Each isolator is modeled by three orthogonal DOF springs. Only one spring set is shown for brevity. The triangles indicate fixed constraints. The origin is at the center of gravity.
The variables $\alpha$, $\beta$, and $\theta$ represent rotations about the X, Y, and Z axes, respectively, using the right-hand rule convention.
Derive the equations of motion. Let n be the number of isolators.

\[ m\ddot{x} = \sum_{i=1}^{n} k_{x,i} (-x - c_i \beta - b_i \theta) \]  \hspace{1cm} (1)

\[ m\ddot{x} + \sum_{i=1}^{n} k_{x,i} (x + c_i \beta + b_i \theta) = 0 \]  \hspace{1cm} (2)

\[ m\ddot{x} + x \sum_{i=1}^{n} k_{x,i} + \beta \sum_{i=1}^{n} k_{x,i} c_i + \theta \sum_{i=1}^{n} k_{x,i} b_i = 0 \]  \hspace{1cm} (3)

\[ m\ddot{y} = \sum_{i=1}^{n} k_{y,i} (-y + c_i \alpha - a_i \theta) \]  \hspace{1cm} (4)

\[ m\ddot{y} + \sum_{i=1}^{n} k_{y,i} (y - c_i \alpha + a_i \theta) = 0 \]  \hspace{1cm} (5)

\[ m\ddot{y} + y \sum_{i=1}^{n} k_{y,i} - \alpha \sum_{i=1}^{n} k_{y,i} c_i + \theta \sum_{i=1}^{n} k_{y,i} a_i = 0 \]  \hspace{1cm} (6)

\[ m\ddot{z} = \sum_{i=1}^{n} k_{z,i} (-z + b_i \alpha + a_i \beta) \]  \hspace{1cm} (7)

\[ m\ddot{z} + \sum_{i=1}^{n} k_{z,i} (z - b_i \alpha - a_i \beta) = 0 \]  \hspace{1cm} (8)

\[ m\ddot{z} + z \sum_{i=1}^{n} k_{z,i} - \alpha \sum_{i=1}^{n} k_{z,i} b_i - \beta \sum_{i=1}^{n} k_{z,i} a_i = 0 \]  \hspace{1cm} (9)
\[ J_x \dddot{x} = -\sum_{i=1}^{n} k_{y,i} (-y + c_i \alpha - a_i \theta) c_i - \sum_{i=1}^{n} k_{z,i} (-z + b_i \alpha + a_i \beta) b_i \]  
\[ J_x \dddot{x} + \sum_{i=1}^{n} k_{y,i} (-y + c_i \alpha - a_i \theta) c_i + \sum_{i=1}^{n} k_{z,i} (-z + b_i \alpha + a_i \beta) b_i = 0 \]  
\[ J_x \dddot{x} - y \sum_{i=1}^{n} k_{y,i} c_i - z \sum_{i=1}^{n} k_{z,i} b_i \]  
\[ + \alpha \sum_{i=1}^{n} [k_{y,i} c_i^2 + k_{z,i} b_i^2] + \beta \sum_{i=1}^{n} [k_{z,i} a_i b_i] - \theta \sum_{i=1}^{n} [k_{y,i} a_i c_i] = 0 \]  
\[ J_y \dddot{y} + \sum_{i=1}^{n} k_{x,i} (-x - c_i \beta - b_i \theta) c_i - \sum_{i=1}^{n} k_{z,i} (-z + b_i \alpha + a_i \beta) a_i \]  
\[ J_y \dddot{y} + x \sum_{i=1}^{n} k_{x,i} c_i - z \sum_{i=1}^{n} k_{z,i} a_i \]  
\[ + \alpha \sum_{i=1}^{n} k_{z,i} a_i b_i + \beta \sum_{i=1}^{n} [k_{x,i} c_i^2 + k_{z,i} a_i^2] + \theta \sum_{i=1}^{n} k_{x,i} b_i c_i = 0 \]  
\[ J_z \dddot{\theta} = \sum_{i=1}^{n} k_{x,i} (-x - c_i \beta - b_i \theta) b_i + \sum_{i=1}^{n} k_{y,i} (-y + c_i \alpha - a_i \theta) a_i \]  
\[ J_z \dddot{\theta} + \sum_{i=1}^{n} k_{x,i} (x + c_i \beta + b_i \theta) b_i + \sum_{i=1}^{n} k_{y,i} (y - c_i \alpha + a_i \theta) a_i = 0 \]
\[ J_z \ddot{\theta} + x \sum_{i=1}^{n} k_{x,i} b_i + y \sum_{i=1}^{n} k_{y,i} a_i \]

\[ - \alpha \sum_{i=1}^{n} k_{y,i} a_i c_i + \beta \sum_{i=1}^{n} k_{x,i} b_i c_i + \theta \sum_{i=1}^{n} [k_{y,i} a_i^2 + k_{x,i} b_i^2] = 0 \]  

(17)

Typically

\[ k_{x,i} = k_x \quad \text{for all } i \]  

(18)

\[ k_{y,i} = k_y \quad \text{for all } i \]  

(19)

\[ k_{z,i} = k_z \quad \text{for all } i \]  

(20)

By substitution, the equations of motion simplify to

\[ m \ddot{x} + x n k_x + \beta k_x \sum_{i=1}^{n} c_i + \theta k_x \sum_{i=1}^{n} b_i = 0 \]  

(21)

\[ m \ddot{y} + y n k_y - \alpha k_y \sum_{i=1}^{n} c_i + \theta k_y \sum_{i=1}^{n} a_i = 0 \]  

(22)

\[ m \ddot{z} + z n k_z - \alpha k_z \sum_{i=1}^{n} b_i - \beta k_z \sum_{i=1}^{n} a_i = 0 \]  

(23)

\[ J_x \ddot{a} - y k_y \sum_{i=1}^{n} c_i - z k_z \sum_{i=1}^{n} b_i \]

\[ + \alpha \sum_{i=1}^{n} [k_{y,i} c_i^2 + k_{z,i} b_i^2] + \beta k_z \sum_{i=1}^{n} [a_i b_i] - \theta k_y \sum_{i=1}^{n} [a_i c_i] = 0 \]  

(24)
\[
J_y \ddot{\beta} + x k_x \sum_{i=1}^{n} c_i - z k_z \sum_{i=1}^{n} a_i \\
+ \alpha k_z \sum_{i=1}^{n} a_i b_i + \beta \sum_{i=1}^{n} [k_x c_i^2 + k_z a_i^2] + \theta k_x \sum_{i=1}^{n} b_i c_i = 0
\]

(25)

\[
J_z \ddot{\theta} + x k_x \sum_{i=1}^{n} b_i + y k_y \sum_{i=1}^{n} a_i \\
- \alpha k_y \sum_{i=1}^{n} a_i c_i + \beta k_x \sum_{i=1}^{n} b_i c_i + \theta \sum_{i=1}^{n} [k_y a_i^2 + k_x b_i^2] = 0
\]

(26)

The equations can be arranged in matrix format.

\[
[M] \begin{bmatrix}
\dot{x} \\
\dot{y} \\
\dot{z} \\
\dot{\alpha} \\
\dot{\beta} \\
\dot{\theta}
\end{bmatrix} + [K] \begin{bmatrix}
x \\
y \\
z \\
\alpha \\
\beta \\
\theta
\end{bmatrix} = \begin{bmatrix} 0 \\
0 \\
0 \\
0 \\
0 \\
0 \end{bmatrix}
\]

(27)

The mass and stiffness matrices are shown in upper triangular form due to symmetry.

\[
[M] = \begin{bmatrix}
m & 0 & 0 & 0 & 0 & 0 \\
m & 0 & 0 & 0 & 0 & 0 \\
m & 0 & 0 & 0 & 0 & 0 \\
J_x & 0 & 0 & 0 & 0 & 0 \\
J_y & 0 & 0 & 0 & 0 & 0 \\
J_z & 0 & 0 & 0 & 0 & 0 
\end{bmatrix}
\]

(28)
\[
\begin{bmatrix}
nk_x & 0 & 0 & 0 & k_x \sum_{i=1}^{n} c_i & k_x \sum_{i=1}^{n} b_i \\
nk_y & 0 & -k_y \sum_{i=1}^{n} c_i & 0 & k_y \sum_{i=1}^{n} a_i \\
nk_z & -k_z \sum_{i=1}^{n} b_i & k_z \sum_{i=1}^{n} a_i & 0 \\
\sum_{i=1}^{n} \left[ k_y c_i^2 + k_z b_i^2 \right] & k_x \sum_{i=1}^{n} [a_i b_i] & -k_y \sum_{i=1}^{n} [a_i c_i] \\
\sum_{i=1}^{n} \left[ k_x c_i^2 + k_z a_i^2 \right] & k_z \sum_{i=1}^{n} b_i c_i & \sum_{i=1}^{n} \left[ k_y a_i^2 + k_x b_i^2 \right]
\end{bmatrix}
\]

(29)
Base Excitation

Consider three separate base excitation cases, following the convention in Reference 1.
The mass and stiffness matrices in equations (28) and (29) apply in each of the cases.
Let $u$, $x$, and $w$ be the base displacement in the X, Y and Z-axes, respectively.

X-axis Excitation

Let

$$r_1 = x - u \quad (30)$$

The equations can be arranged in matrix format.

$$
\begin{bmatrix}
\ddot{r}_1 \\
\dot{y} \\
\ddot{z} \\
\dddot{\alpha} \\
\beta \\
\dddot{\theta}
\end{bmatrix}
+ 
K
\begin{bmatrix}
\dddot{r}_1 \\
y \\
z \\
\dddot{\alpha} \\
\beta \\
\dddot{\theta}
\end{bmatrix}
= 
M
\begin{bmatrix}
0 \\
0 \\
0 \\
0 \\
0 \\
0
\end{bmatrix}
- m \dddot{u}
$$

(31)

Y-axis Excitation

Let

$$r_2 = y - v \quad (32)$$

The equations can be arranged in matrix format.

$$
\begin{bmatrix}
\dddot{x} \\
\dddot{r}_2 \\
\dddot{z} \\
\dddot{\alpha} \\
\dddot{\beta} \\
\dddot{\theta}
\end{bmatrix}
+ 
K
\begin{bmatrix}
x \\
r_2 \\
z \\
\alpha \\
\beta \\
\theta
\end{bmatrix}
= 
M
\begin{bmatrix}
0 \\
0 \\
0 \\
0 \\
0 \\
0
\end{bmatrix}
- m \dddot{v}
$$

(33)
Z-axis Excitation

Let

\[ r_3 = z - w \]  \hspace{1cm} (34)

The equations can be arranged in matrix format.

\[
\begin{bmatrix}
\dot{x} \\
\dot{y} \\
\dot{r}_3 \\
\ddot{\alpha} \\
\ddot{\beta} \\
\ddot{\theta}
\end{bmatrix}
+\begin{bmatrix}
x \\
y \\
r_3 \\
\alpha \\
\beta \\
\theta
\end{bmatrix}
= \begin{bmatrix}
0 \\
0 \\
-\text{m} \dot{w}
\end{bmatrix}
\]

\hspace{1cm} (35)

The acceleration transmissibility functions of equations (31), (33) and (35) can then be determined via Reference 2.

The modal transient response to a base input time history can be calculated via References 3 and 4.
