Introduction
Consider the single-degree-of-freedom system subjected to an applied force in Figure 1.

Figure 1.
where

$$
\begin{aligned}
\mathrm{F}(\mathrm{t}) & =\text { Applied force } \\
\mathrm{c} & =\text { viscous damping coefficient } \\
\mathrm{k} & =\text { stiffness } \\
\mathrm{x} & =\text { displacement }
\end{aligned}
$$

Summation of forces in the vertical direction yields the equation of motion.

$$
\begin{equation*}
\mathrm{c} \dot{\mathrm{x}}+\mathrm{kx}=\mathrm{F}(\mathrm{t}) \tag{1}
\end{equation*}
$$

Derive the transfer function by taking the Laplace transform.

$$
\begin{equation*}
\mathrm{L}\{\mathrm{c} \dot{\mathrm{x}}+\mathrm{kx}\}=\mathrm{L}\{\mathrm{~F}(\mathrm{t})\} \tag{2}
\end{equation*}
$$

$$
\begin{align*}
& \operatorname{csX}(\mathrm{s})-\mathrm{cx}(0)+\mathrm{kX}(\mathrm{~s})=\mathrm{F}(\mathrm{~s})  \tag{3}\\
& {[\mathrm{cs}+\mathrm{k}] \mathrm{X}(\mathrm{~s})=\mathrm{F}(\mathrm{~s})+\mathrm{cx}(0)}  \tag{4}\\
& \mathrm{X}(\mathrm{~s})=\frac{\mathrm{F}(\mathrm{~s})+\mathrm{cx}(0)}{\mathrm{cs}+\mathrm{k}} \tag{5}
\end{align*}
$$

Now assume that the initial displacement is zero.

$$
\begin{equation*}
X(s)=\frac{F(s)}{c s+k} \tag{6}
\end{equation*}
$$

$$
\begin{equation*}
\frac{X(s)}{F(s)}=\frac{1}{c s+k} \tag{7}
\end{equation*}
$$

The dynamic stiffness in the Laplace domain is

$$
\begin{equation*}
\frac{F(s)}{X(s)}=c s+k \tag{7}
\end{equation*}
$$

The dynamic stiffness in the frequency domain is

$$
\begin{equation*}
\frac{F(\omega)}{X(\omega)}=k+j c \omega \tag{8}
\end{equation*}
$$

The initial value problem for the free response is

$$
\begin{equation*}
X(s)=\frac{c x(0)}{\operatorname{cs}+k} \tag{9}
\end{equation*}
$$

$$
\begin{equation*}
X(s)=\frac{x(0)}{s+(k / c)} \tag{10}
\end{equation*}
$$

The inverse Laplace transform yields the time domain response.

$$
\begin{equation*}
\mathrm{x}(\mathrm{t})=\mathrm{x}(0) \exp [(\mathrm{k} / \mathrm{c}) \mathrm{t}] \tag{11}
\end{equation*}
$$

## APPENDIX A

Consider the single-degree-of-freedom system subjected to an applied force.

Figure A-1.

The equation of motion is

$$
\begin{equation*}
\mathrm{m} \ddot{\mathrm{x}}+\mathrm{c} \dot{\mathrm{x}}+\mathrm{kx}=\mathrm{F}(\mathrm{t}) \tag{A-1}
\end{equation*}
$$

Derive the transfer function by taking the Laplace transform.

$$
\begin{gather*}
\mathrm{L}\{\mathrm{~m} \ddot{\mathrm{x}}+\mathrm{c} \dot{\mathrm{x}}+\mathrm{kx}\}=\mathrm{L}\{\mathrm{~F}(\mathrm{t})\}  \tag{A-2}\\
\mathrm{ms}^{2} \mathrm{X}(\mathrm{~s})-\mathrm{m} \dot{\mathrm{x}}(0)-\operatorname{msx}(0)+\operatorname{csX}(\mathrm{s})-\mathrm{cx}(0)+\mathrm{kX}(\mathrm{~s})=\mathrm{F}(\mathrm{~s}) \tag{A-3}
\end{gather*}
$$

$$
\begin{align*}
& \mathrm{ms}^{2}+\mathrm{cs}+\mathrm{k} \int \mathrm{X}(\mathrm{~s})=\mathrm{F}(\mathrm{~s})+\mathrm{cx}(0)+\mathrm{m} \dot{\mathrm{x}}(0)+\mathrm{msx}(0)  \tag{A-4}\\
& \mathrm{X}(\mathrm{~s})=\frac{\mathrm{F}(\mathrm{~s})+\mathrm{cx}(0)+\mathrm{m} \dot{\mathrm{x}}(0)+\mathrm{msx}(0)}{\mathrm{ms}^{2}+\mathrm{cs}+\mathrm{k}} \tag{A-5}
\end{align*}
$$

Now assume that the initial displacement is zero.

$$
\begin{align*}
& X(s)=\frac{F(s)}{\mathrm{ms}^{2}+\mathrm{cs}+\mathrm{k}}  \tag{A-6}\\
& \frac{X(\mathrm{~s})}{\mathrm{F}(\mathrm{~s})}=\frac{1}{\mathrm{~ms}^{2}+\mathrm{cs}+\mathrm{k}} \tag{A-7}
\end{align*}
$$

The dynamic stiffness in the Laplace domain is

$$
\begin{equation*}
\frac{\mathrm{F}(\mathrm{~s})}{\mathrm{X}(\mathrm{~s})}=\mathrm{ms}^{2}+\mathrm{cs}+\mathrm{k} \tag{A-8}
\end{equation*}
$$

The dynamic stiffness in the frequency domain is

$$
\begin{equation*}
\frac{\mathrm{F}(\omega)}{\mathrm{X}(\omega)}=\mathrm{k}-\mathrm{m} \omega^{2}+\mathrm{jc} \omega \tag{A-9}
\end{equation*}
$$

The mechanical impedance in the frequency domain is

$$
\begin{equation*}
\frac{F(\omega)}{V(\omega)}=\frac{k-m \omega^{2}+j c \omega}{j \omega} \tag{A-10}
\end{equation*}
$$

$$
\begin{equation*}
\frac{F(\omega)}{V(\omega)}=c+j\left[-\frac{k}{\omega}+m \omega\right] \tag{A-11}
\end{equation*}
$$

The apparent mass in the frequency domain is

$$
\begin{equation*}
\frac{F(\omega)}{A(\omega)}=\frac{c+j\left[-\frac{k}{\omega}+m \omega\right]}{j \omega} \tag{A-12}
\end{equation*}
$$

$$
\begin{equation*}
\frac{F(\omega)}{A(\omega)}=\left[m-\frac{k}{\omega^{2}}\right]-j \frac{c}{\omega} \tag{A-13}
\end{equation*}
$$

$$
\begin{equation*}
\frac{F(\omega)}{A(\omega)}=m\left\{\left[1-\frac{k}{m \omega^{2}}\right]-j \frac{c}{m \omega}\right\} \tag{A-14}
\end{equation*}
$$

Note that

$$
\begin{align*}
& \omega_{\mathrm{n}}=\sqrt{\frac{\mathrm{k}}{\mathrm{~m}}}  \tag{A-15}\\
& \mathrm{c}=2 \xi \omega_{\mathrm{n}} \mathrm{~m}  \tag{A-16}\\
& \eta=2 \xi \tag{A-17}
\end{align*}
$$

By substitution,

$$
\begin{align*}
& \frac{F(\omega)}{A(\omega)}=m\left\{\left[1-\frac{\omega_{n}^{2}}{\omega^{2}}\right]-j \frac{2 \xi \omega_{n}}{\omega}\right\}  \tag{A-18}\\
& \frac{F(\omega)}{A(\omega)}=m\left\{\left[1-\frac{\omega_{n}^{2}}{\omega^{2}}\right]-j \frac{\eta \omega_{n}}{\omega}\right\} \tag{A-19}
\end{align*}
$$

## APPENDIX B

Consider the following two-degree-of-freedom system subjected to an applied force.

Figure B-1.

The free-body diagrams are

Figure B-2.

The equations of motion are

$$
\begin{align*}
& \mathrm{k}\left(\mathrm{x}_{1}-\mathrm{x}_{2}\right)+\mathrm{F}(\mathrm{t})=0  \tag{B-1}\\
& \mathrm{k}\left(\mathrm{x}_{2}-\mathrm{x}_{1}\right)=\mathrm{F}(\mathrm{t})  \tag{B-2}\\
& \mathrm{c} \dot{\mathrm{x}}_{1}+\mathrm{k}\left(\mathrm{x}_{1}-\mathrm{x}_{2}\right)=0 \tag{B-3}
\end{align*}
$$

Solve for $\mathrm{x}_{2}$ using Equation (B-2).

$$
\begin{equation*}
x_{2}=\frac{F(t)}{k}+x_{1} \tag{B-4}
\end{equation*}
$$

By substitution,

$$
\begin{align*}
& c \dot{x}_{1}+k\left(x_{1}-x_{2}\right)=0  \tag{B-5}\\
& c \dot{x}_{1}+k\left(x_{1}-\frac{F(t)}{k}-x_{1}\right)=0  \tag{B-6}\\
& c \dot{x}_{1}+k\left(-\frac{F(t)}{k}\right)=0  \tag{B-7}\\
& c \dot{x}_{1}=F(t) \tag{B-8}
\end{align*}
$$

Take the Laplace transform.

$$
\begin{equation*}
\mathrm{L}\left\{\mathrm{c} \dot{\mathrm{x}}_{1}\right\}=\mathrm{L}\{\mathrm{~F}(\mathrm{t})\} \tag{B-9}
\end{equation*}
$$

$$
\begin{align*}
& \operatorname{csX_{1}}(\mathrm{s})-\mathrm{cx}_{1}(0)=\mathrm{F}(\mathrm{~s})  \tag{B-10}\\
& \operatorname{csX_{1}}(\mathrm{s})=\mathrm{F}(\mathrm{~s})+\mathrm{cx}_{1}(0)  \tag{B-11}\\
& \mathrm{X}_{1}(\mathrm{~s})=\frac{\mathrm{F}(\mathrm{~s})+\mathrm{cx}_{1}(0)}{\mathrm{cs}} \tag{B-12}
\end{align*}
$$

Recall

$$
\begin{equation*}
\mathrm{k}\left(\mathrm{x}_{2}-\mathrm{x}_{1}\right)=\mathrm{F}(\mathrm{t}) \tag{B-13}
\end{equation*}
$$

Take the Laplace transform.

$$
\begin{align*}
& \mathrm{L}\left\{\mathrm{k}\left(\mathrm{x}_{2}-\mathrm{x}_{1}\right)\right\}=\mathrm{L}\{\mathrm{~F}(\mathrm{t})\}  \tag{B-14}\\
& \mathrm{k} X_{2}(\mathrm{~s})-\mathrm{k} X_{1}(\mathrm{~s})=\mathrm{F}(\mathrm{~s})  \tag{B-15}\\
& \mathrm{k} X_{2}(\mathrm{~s})=\mathrm{F}(\mathrm{~s})+\mathrm{k} \mathrm{X}_{1}(\mathrm{~s})  \tag{B-16}\\
& \mathrm{kX}_{2}(\mathrm{~s})=\mathrm{F}(\mathrm{~s})+\mathrm{k}\left\{\frac{\mathrm{~F}(\mathrm{~s})+\mathrm{cx}_{1}(0)}{\mathrm{cs}}\right\}  \tag{B-17}\\
& \mathrm{k} X_{2}(\mathrm{~s})=\mathrm{F}(\mathrm{~s})\left[1+\frac{\mathrm{k}}{\mathrm{cs}}\right]+\frac{\mathrm{k}}{\mathrm{~s}} \mathrm{x}_{1}(0)  \tag{B-18}\\
& \mathrm{X}_{2}(\mathrm{~s})=\mathrm{F}(\mathrm{~s})\left[\frac{1}{\mathrm{k}}+\frac{1}{\mathrm{cs}}\right]+\frac{1}{\mathrm{~s}} \mathrm{x}_{1}(0) \tag{B-19}
\end{align*}
$$

Now assume the initial displacement is zero.

$$
\begin{align*}
& X_{2}(\mathrm{~s})=\mathrm{F}(\mathrm{~s})\left[\frac{1}{\mathrm{k}}+\frac{1}{\mathrm{cs}}\right]  \tag{B-20}\\
& \mathrm{X}_{2}(\mathrm{~s})=\mathrm{F}(\mathrm{~s})\left[\frac{\mathrm{cs}+\mathrm{k}}{\mathrm{cks}}\right] \tag{B-21}
\end{align*}
$$

The receptance in the Laplace domain is

$$
\begin{equation*}
\frac{X_{2}(\mathrm{~s})}{\mathrm{F}(\mathrm{~s})}=\frac{\mathrm{cs}+\mathrm{k}}{\mathrm{cks}} \tag{B-22}
\end{equation*}
$$

The dynamic stiffness in the Laplace domain is

$$
\begin{equation*}
\frac{F(s)}{X_{2}(s)}=\frac{c k s}{c s+k} \tag{B-22}
\end{equation*}
$$

The dynamic stiffness in the frequency domain is

$$
\begin{equation*}
\frac{F(\omega)}{X_{2}(\omega)}=\frac{\mathrm{jck} \omega}{\mathrm{k}+\mathrm{jc} \omega} \tag{B-22}
\end{equation*}
$$

The initial value problem for the free response is

$$
\begin{equation*}
X_{2}(s)=\frac{1}{s} x_{1}(0) \tag{B-23}
\end{equation*}
$$

The inverse Laplace transform yields the time domain response in terms of the unit step function $u(t)$.

$$
\begin{equation*}
x_{2}(t)=x_{1}(0) u(t) \tag{B-24}
\end{equation*}
$$

This can be simplified as

$$
\begin{equation*}
x_{2}(t)=x_{1}(0) \tag{B-25}
\end{equation*}
$$

Likewise

$$
\begin{equation*}
\mathrm{x}_{1}(\mathrm{t})=\mathrm{x}_{1}(0) \tag{B-26}
\end{equation*}
$$
